COVID-19 Indicator Trends-Woodbury County
August 7, 2020 Update

Current Status: For the week ending August 2nd our current data shows that we have 81 newly confirmed cases out of 1,286 tests for a rate of 6 percent positive. This will most likely change next week, when additional test results are added when results are received. In these graphs, the cases and tests are shown during the week the samples were collected, and not the week that the results were reported, which better illustrates the timeframe during which people were sick and seeking care. Duplicate tests for an individual have been removed.

We continue to maintain a 7-8 percent level of positive test results. To consider a level of containment of COVID-19, 2 percent or less should be the goal for this indicator.

Percentage of Tests Positive

We continue to see new cases daily; continued efforts on reducing this spread is necessary. 

Wearing masks when in public has shown to reduce the spread. Staying home if you or a household member are not feeling well, social distancing, and washing or disinfecting hands regularly are still recommended practices.
